

What is claimed is:

1. A module-structure for roof trim for use in installing a roof trim and various accessories to an interior side of a vehicle roof panel by placing bracket having a spacer function between the roof trim and the roof panel in the positions matching the accessories, said module-structure comprising:

attachment members formed on said accessories, wherein said attachment members are connected into the bracket provided on the back side of the roof trim through openings in the roof trim so that accessories, roof trim and brackets are temporarily secured; are then aligned with the position corresponding to attachment holes in the roof panel; and are inserted into the roof panel and protruded in the fitting direction, thereby engaging connecting portions with the attachment holes of the roof panel; and

an inserted body inserted into the attachment members, wherein said inserted body locks the connecting portions of said attachment members by insertion so that said roof trim and accessories are integrally assembled to said roof panel through said bracket.

2. The module-structure for roof trim according to claim 1, wherein said attachment members are temporarily supported within said bracket by a securing structure where said bracket and said attachment members are temporarily secured in the sub-attaching position when said attachment members of said accessories are inserted into said brackets through said openings in said roof trim.

3. The module-structure for roof trim according to claim 2, wherein claws on one side and grooves on the other side, said grooves being engaged with the claws, are provided in the securing structure between said attachment members of said accessories and said bracket.

4. The module-structure for roof trim according to claim 3, wherein said attachment members of said accessories are held in a locked position by providing a securing structure where said attachment members and said bracket are secured in a state in which said attachment members of said accessories protrude towards a vehicle body panel.

5. The module-structure for roof trim according to any of claims 1 through 4, wherein said brackets are composed of a resin molding formed in a hollow box shape and have a function to absorb an impact due to side collision of the vehicle.
